Dear Hiring Team,

I'm really excited about the **Junior Software Developer role on the Procyon team**. I've always been fascinated by hardware performance, and I love working where software optimization meets real hardware limits.

My computer science and electrical engineering background gave me solid experience in both software and hardware debugging. At Microsoft, I worked on **VR/XR features that had to run smoothly on constrained headsets**. I spent a lot of time digging into the rendering pipeline and optimizing our features until they actually worked well for research scenarios. For my master's project, I built an interactive cloud simulation using particle methods. It started at just 1-2 FPS, but after lots of tweaking and reworking the approach, I got it running at around 50 FPS on a laptop GPU. I also did parallel computing work as a developer for a university course. **These experiences really deepened my interest in performance profiling.**

Outside work, benchmarking is basically my favorite geeky hobby. I built my own ITX PC, run PCMark 10 regularly, and tried tuning memory timings and stress-testing hardware. My previous laptop might have met its early retirement thanks to all my testing! I've also hacked together personal projects like turning old drives into a DIY NAS. **I pick up new technical environments quickly because I understand how software and hardware interact.**

I'd love to contribute to UL's benchmarking products and learn from a team that's as passionate about performance and precision as I am. It would be a blast to work on tools that help people understand and compare the devices they use every day.

Thanks for considering my application. I'd be happy to chat more about how I could help the Procyon team!

Best regards,
Jinda
