

Jinda Li

Unreal Engine Developer

✉ [Email](#)
🌐 [Portfolio](#)
🔗 [LinkedIn](#)

Versatile Unreal Engine Developer with 3+ years of professional experience in XR development. Proven expertise in performance optimization and real-time systems, delivering scalable solutions for complex immersive applications.

WORK EXPERIENCE

Unity Developer

Mixed Reality, Microsoft

Research projects to deliver state-of-the-art products

Feb. 2024 - Mar. 2025

Multi-Camera Rendering Optimization: Architected a high-fidelity **AR-in-VR simulation** environment in Unity, handling 6~8 concurrent camera views on resource-limited HMD hardware. Optimized the pipeline to a **stable 40+ FPS** by utilizing **Unity Profiler/Frame Debugger** to eliminate draw-call bottlenecks.

Asynchronous Procedural Systems: Engineered a real-time procedural city generation system utilizing an improved Wave Function Collapse (WFC) algorithm. Decoupled heavy constraint-solving from the main thread using the **C# Job System and Burst Compiler**.

Unreal Developer

AI-Driven Open World Game, Microfeel

Start-up company focusing on Generative AI and UGC in Games

Sep. 2023 - Apr. 2024

LLM-Powered Procedural World: Engineered a **semantic-to-geometry pipeline** using LLM to automate procedural world generation in Unreal, translating natural languages to deterministic UGC world.

3D Gaussian Splatting Demo: Pioneered the integration of 3DGS in Unity for interactions in realistic scenes.

Game Designer Intern

Naraka: Bladepoint, NetEase Games

Action-adventure battle royale game, 180k concurrent steam players at peak

May. 2021 - Jul. 2021

Animation Pipeline Optimization: Served as the interface for integrating animation assets into the game engine. Optimized asset requirement standards to reduce integration errors between Art and Engineering, improving production efficiency.

Movement Refinement: Refined trigger shapes to support seamless movement across large-scale combat zones.

PROJECT EXPERIENCE

A Cloud's Adventure Roles: Solo Developer

[\[Link to Video\]](#) Technical Implementation for an Interactive Cloud Avatar

Advanced Fluid & Particle Simulation: Engineered a real-time interactive cloud system in **Unreal Engine** using GPU particles and custom Position-Based Dynamics solver, showcasing advanced graphics programming expertise.

Volumetric Rendering: Implemented ray-marched material from rasterized particle data, supporting fake multiple scattering and powder effect.

Performance Optimization: Reduced computational cost by spatial partitioning to achieve 60 FPS on a laptop, demonstrating practical optimization for **resource-constrained environments**.

SKILLS

Unity

Unreal

C++/C#

HLSL

Shader

VR/AR

CI / CD

Python

Parallel Programming

Git / P4

Blender

Unity DOTS

Linux

EDUCATION

Game Design and Production, Aalto University
Master of Science 2021- 2025

Electrical Engineering, Southeast University (China)
Bachelor of Engineering 2016-2020
